Tryps

The travel agent in your iMessage group chat

Jake Stein | Founder

The Problem

Planning a group trip is broken.

- **47 texts** to pick a restaurant. Nobody books it.
- The "planner friend" does all the work. Everyone else ghosts.
- Details are scattered across iMessage, Google Docs, Venmo, and someone's Notes app
- By the time you land, half the group doesn't know the plan

> The group chat is where trips get planned. But nothing that happens there turns into action.

Three Layers. One Experience.

Where people already are. What they want to see. What gets done for them.

How Tryps Works

Layer 1: iMessage — Where most people interact

Add the Tryps contact to your group chat. That's it. Tryps listens to everything you text and **actively plans your trip in the background**. No new app required for most of the group.

Layer 2: Mobile App — For people who want to see the plan

- Clean itinerary with voting on activities
- See when everyone's landing and who's involved
- Vote on stays, log expenses, track the group

Layer 3: Agent Layer — AI that executes on your behalf

Built on **X402 protocols** — our agent can search, book, and coordinate on behalf of the group. From the second you join, you're asked what you want this trip to feel like. Then it's planned *for* you.

The Setup Ramp

Trips are better when everything is connected. There's a simple setup:

- **Credit card** — for seamless group payments
- **Airline accounts** — Delta, United, etc. (that's how you get there)
- **Hotel / Airbnb** — account connections for booking

Once connected, this is the **easiest and best way to book a group trip**. The agent has everything it needs to act on your behalf.

We Don't Just Know What You Like. We Know Why You Travel.

THREE LAYERS OF TRAVELER UNDERSTANDING

Layer	What It Captures	How Tryps Gets It
Traits (Trip Vibe)	Beach vs. city, chill vs. packed	A/B vibe quiz at trip creation
Adaptations (Trip Intent)	What you want from *this* trip	One open-ended question + NLP
Narrative (Travel DNA)	Why you travel — your evolving story	Cross-trip pattern recognition

> Based on Dan McAdams' (Northwestern) three-level personality framework. No travel app thinks about personality at this depth.

The Flywheel

Trip Vibe captures preferences on day 1

Trip Intent adapts to what you want *this time*

Travel DNA compounds across every trip you take

Each layer makes the agent smarter → which makes the next trip better → which deepens the data

Nobody else has this. This is the personality graph that compounds with every trip.

Why Now & Right to Win

The Honest Assessment

Everybody can make a viral mobile app. We've seen it:

- **Partiful** did it for parties
- **Strava** did it for running
- **Beli** did it for restaurants

Simple UI, friends share it, captures data. We do it for travel.

But we don't think the mobile app alone gives us any right to win. Other players probably have a better right to win on mobile alone.

Where We Actually Win

Nobody has taken the mobile app and **integrated these two layers on top and beneath it.**

iMessage: Where the conversation already lives

- Partnered with Linq for best-in-class iMessage infrastructure
- **Nobody** can do native group polling in iMessage today
- We are the first beta tester of Linq's polling feature
- When it deploys, we are the **only platform** where people vote on trip decisions in iMessage

Agent Layer: AI that executes the plan

- X402 protocols enable our agent to search, book, and coordinate
- Triggered directly from the iMessage conversation
- No context switching. No app hopping. The agent just does it.

The Moat is the Stack

1. **iMessage** — where the conversation already lives (no behavior change)
2. **Mobile App** — for people who want visibility and control
3. **Agent Layer** — AI that executes the plan end-to-end

Nobody else has all three. That's the right to win.

Memory as a Service

We're not selling a planning tool. **We're selling memory.**

Tryps holds the shared context between individuals — what the group decided, preferred, voted on, and experienced together.

- Every trip generates structured data: preferences, votes, decisions, itineraries, splits, memories
- That context lives in **our system**, not scattered across iMessage threads and Google Docs
- The more trips a group takes together, the **richer the shared memory** becomes

> Shared memory makes the next trip easier → which brings users back → which deepens the memory. That's the flywheel.

Technology Edge: Autoresearch

A 5-PERSON TEAM SHIPPING WITH THE VELOCITY OF A 20-PERSON TEAM

We don't just use AI to write code. **We use AI to optimize our AI.**

The autoresearch pattern (Karpathy, 2025):

1. Define a **metric** you can measure automatically
2. Give an agent permission to **modify one thing** (a prompt, a recommendation, a matching algorithm)
3. Let it **run experiments overnight** — hundreds of variants, tested and scored

We wake up to a changelog of research. The best-performing variant ships.

Market Opportunity

The Travel Market

The group travel market is massive and underserved by technology.

- **Expedia:** $30B+ market cap, 100M+ monthly users
- **Booking.com:** $140B+ market cap
- **Partiful:** Proved the viral group-event thesis. Events → Travel is a natural extension.

> "If we captured just 1% of Expedia's user base, the math works."

Path to the Plane

WHAT JAKE'S TRAVEL LIFE LOOKS LIKE AT EACH MILESTONE

Tier	What It Means	Revenue Needed	Users (Base Case)
First Class Everywhere	Lie-flat international, lounges	~$150K/yr	179K users
NetJets Card	Skip TSA forever, text your pilot	~$500K/yr	595K users
Own a Plane + 6 Friends	Challenger 350, Tulum on Tuesday	~$4.8M/yr	5.7M users
The Fleet	Two G650s, send anyone anywhere	~$26M/yr	30.9M users

> Base case assumes 8% blended take rate, 15% paid conversion, 20% operating margins.

The Ask

What We're Building

- **The travel agent** that lives where people already plan trips
- **The personality graph** that compounds with every group trip
- **The memory layer** that makes the agent smarter over time
- **The execution engine** that turns conversation into booked travel
